ORBO DIYA

BRAND IDENTITY & USAGE GUIDE

YOUR PERSONAL AI COMPANION

THINK. REMEMBER. PLAN. ACT.

Version 1.0 • Working production starter kit • 11 October 2026

1. Brand foundation

Brand hierarchy: OPRAIZ is the parent brand; ORBO is the primary product name; Diya is the secondary name. Use “ORBO Diya” consistently in full product references, and “ORBO” where a compact product name is required.

Positioning: A personal AI companion designed around intelligence, continuity and action. The identity should feel premium and capable without becoming visually noisy.

Approved messaging

Primary descriptor: **Your Personal AI Companion.**
Brand line: **Think. Remember. Plan. Act.**

2. Logo system

The orbital ring is the core identifier. Do not replace it with a lamp, flame, generic chatbot bubble, or a different orbital symbol. Keep the mark proportionally scaled and retain its open center and gradient character.

Primary lockup — dark

Horizontal lockup — dark

Stacked lockup — dark

3. Colour system

Use Obsidian and Ivory as the foundational surfaces. Deep Teal and Rich Teal support interface elements; blue, violet and copper appear primarily in the orbital gradient and selective highlights. Avoid using every accent at once.

Colour	HEX	Primary role
Obsidian	#080F14	Primary dark background
Deep Teal	#006E7A	UI / supporting colour
Rich Teal	#00C2D4	Highlights
Cinematic Blue	#2F6BFF	Gradient / active states
Violet	#8A3FFC	Gradient accent
Copper	#F6C284	Warm accent
Ivory	#FFF9F1	Light background
Slate	#667782	Secondary text

Gradient stops: 0% Violet #8A3FFC → 25% Cinematic Blue #2F6BFF → 55% Rich Teal #00C2D4 → 85% Copper #F6C284 → 100% Ivory #FFF9F1. These are the working values for this kit; verify against the approved master before release.

4. Typography

Primary — Montserrat: wordmarks, display headlines and short brand statements. Suggested weights: Medium, SemiBold and Bold.

Secondary — Inter: product UI, long-form text, labels and technical information. Suggested weights: Regular, Medium and SemiBold.

Do not use letter spacing as a substitute for consistent logo geometry. For final brand wordmarks, convert text to outlines in the design source to prevent font substitution.

5. Clear space, sizes and backgrounds

Clear space: maintain a minimum buffer equal to the visible ring stroke width on every side of the complete lockup. Increase space wherever possible.

Minimum sizes: icon-only mark 24 px high for digital use and 8 mm high for print. For wordmark lockups, use 160 px wide digitally and 30 mm wide in print as recommended starting points; test legibility in the actual application.

Backgrounds: use the light logo on Obsidian or other approved dark surfaces, and the dark logo on Ivory or clean light surfaces. Avoid busy photographs directly behind the logo; use a controlled panel if needed.

6. Incorrect usage

Never stretch or squash the logo; rotate the ring; alter the approved gradient arbitrarily; add extra glow, shadow, bevels or outlines; change the relative size of ORBO and DIYA; crowd the clear space; or use low-contrast backgrounds.

7. App icons and digital assets

The kit includes icon PNGs at 1024, 512, 256, 64, 32 and 16 px, plus a light-background variant. Treat these as base exports: apply the current Apple/Google/Microsoft masking, padding, colour-profile and store requirements during platform integration.

8. Brand applications

Use the ring as the visual anchor across app launch screens, website headers, social avatars, product packaging and merchandise. Keep application layouts simple: one dominant message, one brand lockup, and one clear action.

9. Delivery and approval status

This is a complete starter kit with vector-style SVG logo variants, raster app icons, colour specifications, and a PDF guide. Important: the SVG ring and lockups are reconstructed approximations based on the visual reference in this conversation, not verified source vectors. Before commercial publication, compare them with the exact approved logo master and replace geometry if necessary. HEX values are consistent working specifications, not laboratory-verified samples from the reference image.

Final pre-release checklist

- ■ Confirm master logo geometry against approved source
- ■ Approve palette and gradient stops
- ■ Confirm licensed font files and fallback behaviour
- ■ Test icon legibility at 16, 24, 32 and 64 px
- ■ Validate platform store requirements
- ■ Check contrast and accessibility in product UI
- ■ Export final vector outlines and print-ready CMYK files
